Implement Client Script & UI Policy (Incident)

UI Policy, UI Policy Actions and Client Scripts

1. Description

Problem Statement

Incident records need consistent and accurate data entry. Relying on manual checks leads to incomplete or incorrect data, which affects reporting and SLA compliance. Field behavior and validation must be enforced directly on the form.

Objective

To show how UI Policies and Client Scripts enforce data integrity on Incident records by making fields mandatory, auto-populating values, controlling field behavior and blocking save when conditions are not met.

2. Process

Task 1: Create UI Policy on Incident

1. Go to System UI > UI Policies and click New.
2. Enter Short description: High Impact Control, Table: Incident, Active: true.
3. Add condition: Impact is 1 - High, and tick Reverse if false.
4. Submit, then add a UI Policy Action for Assignment group with Mandatory: True.

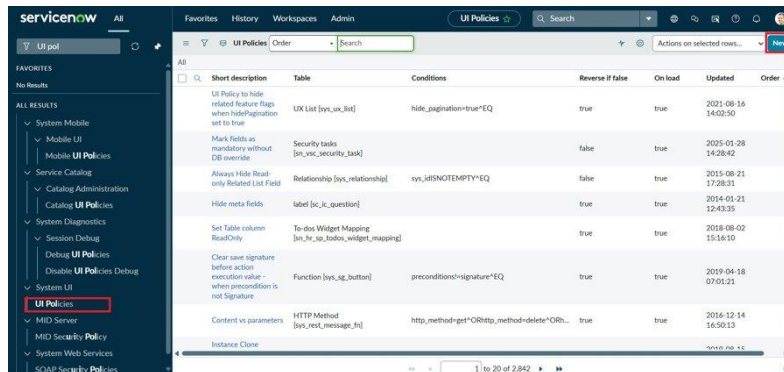

Fig 1: UI Policies list

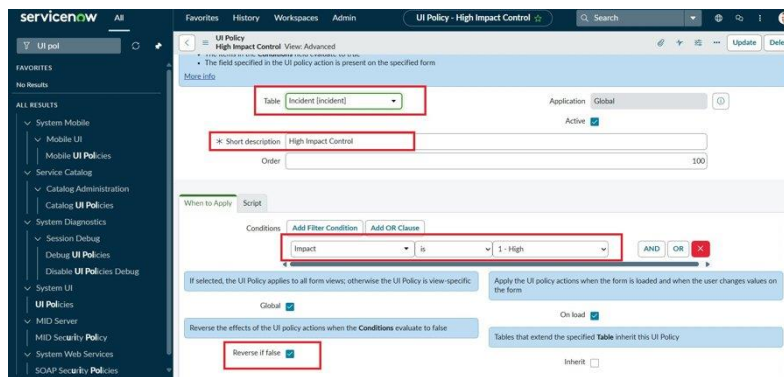

Fig 2: High Impact Control UI Policy

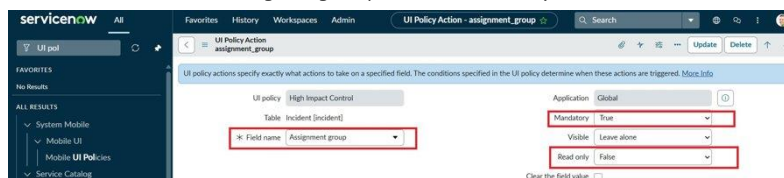

Fig 3: UI Policy Action: Assignment group

Task 2: Create UI Policy Action - Urgency

1. Open the High Impact Control policy and create a new UI Policy Action.
2. Select Field name: Urgency, set Read only: True and leave Visible as is, then Submit.

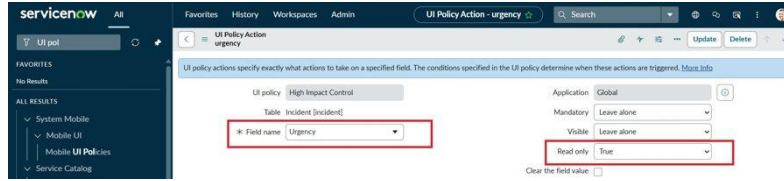

Fig 4: UI Policy Action: Urgency

Task 3: Create onChange Client Script

1. Go to System UI > Client Scripts and click New.
2. Name: Auto set urgency for high impact, Table: Incident, Type: onChange, Field name: Impact.
3. Paste the script that sets Urgency to 1 when Impact is 1 and click Submit.

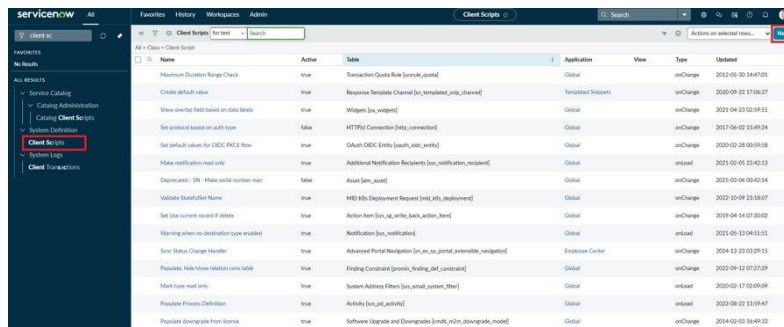

Fig 5: Client Scripts list

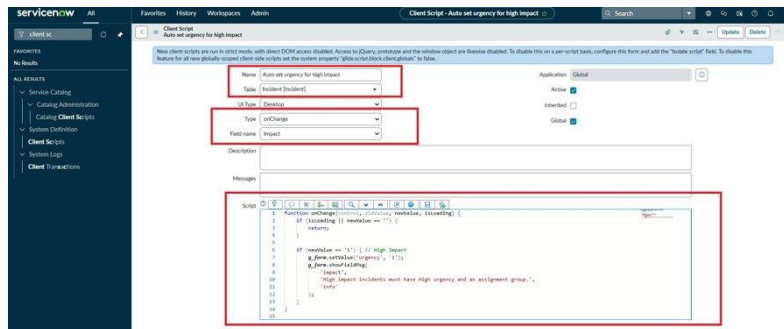

Fig 6: onChange client script

Task 4: Create onSubmit Client Script

1. Create a new Client Script: Prevent save if assigned to missing, Type: onSubmit.
2. Script checks Impact = 1 and empty Assigned to, shows an error box and returns false. Submit.

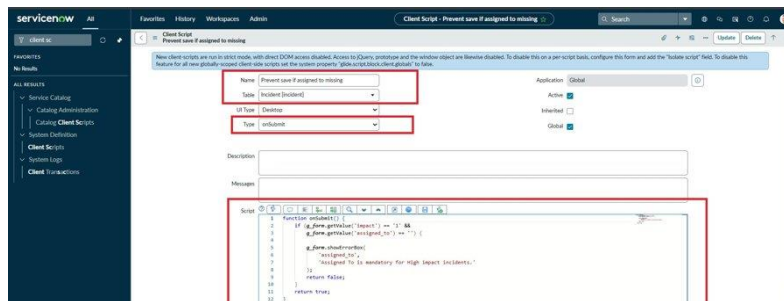

Fig 7: onSubmit client script

Task 5: Create onCellEdit Client Script

1. Create a new Client Script: Prevent state change via list edit, Type: onCellEdit, Field name: State.
2. Script shows an alert and cancels the list edit through the callback. Submit.

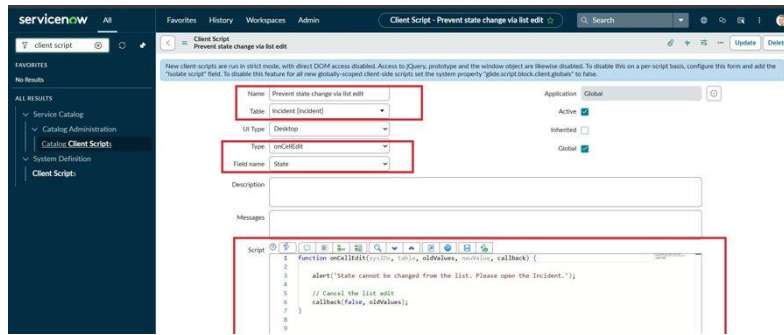

Fig 8: onCellEdit client script

Task 6: Testing the Configuration

1. Open Incident > Create New, set Impact to High and leave Assigned to empty. Submit: the save is blocked with an error message.
2. Fill Assigned to and Submit: the incident saves, Urgency is set to High and Priority is Critical.
3. Change Impact from High to Medium: Assigned to is no longer mandatory and Urgency becomes editable.
4. In the Incident list, double-click State: an alert blocks the change. Changing State from the form saves successfully.

Fig 15: State updated in list

3. Result

- An Incident with High impact cannot be saved without Assigned to, and an error message is shown.
- Urgency is set to High automatically and made read-only; it becomes editable again when Impact changes (Reverse if false).
- State cannot be changed from the list view, but can be updated from the form.

Conclusion: UI Policies and Client Scripts together enforce dynamic field behavior, automate updates and prevent incorrect submissions, keeping Incident data clean and consistent.
